Project Title
 Horizon — Intelligent Systems for Evolving Workflows

Project Description
 Horizon is an exploratory initiative aimed at understanding how adaptive intelligence can enhance team workflows in dynamic, fast-changing environments. The system is expected to evolve alongside user needs, offering contextual support, automation, and insight generation without relying on rigid structures or predefined roles.

Objective
 To explore how intelligent systems can support evolving team workflows in dynamic environments.

Scope
 The system should adapt to changing user needs and provide meaningful support across multiple phases of work. It may involve automation, data handling, and some form of insight generation.

Team Composition
 A small team will be formed. Specific roles and responsibilities will be defined as the project evolves.
